

# Click events in Adobe Edge project

How to create click events in your Adobe Edge project

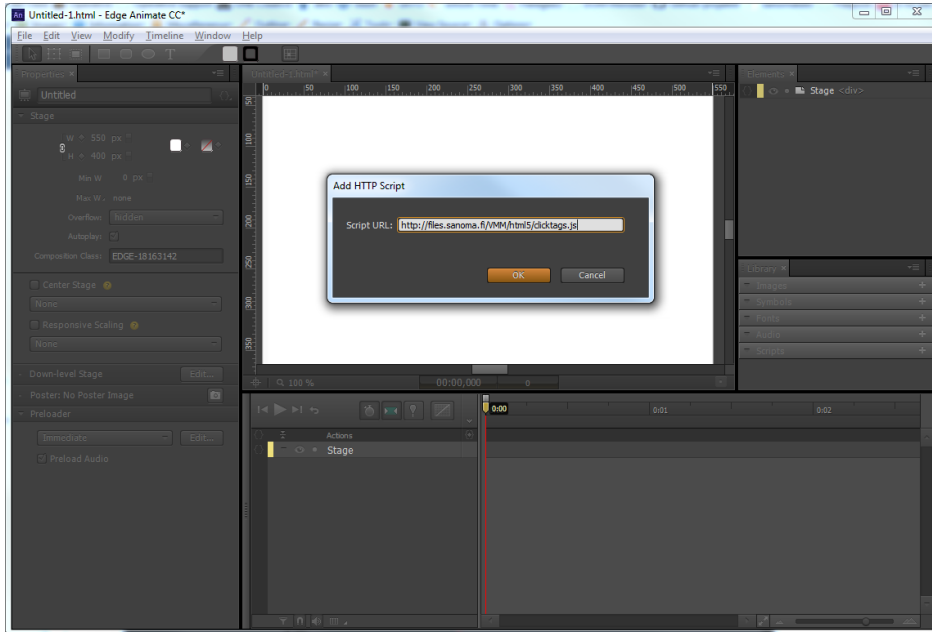

1. Start a new Edge project, blank or from any template.
2. In the Library panel, locate “Scripts” and click on the plus sign to add a script file. Choose “Add JS File from URL...”.

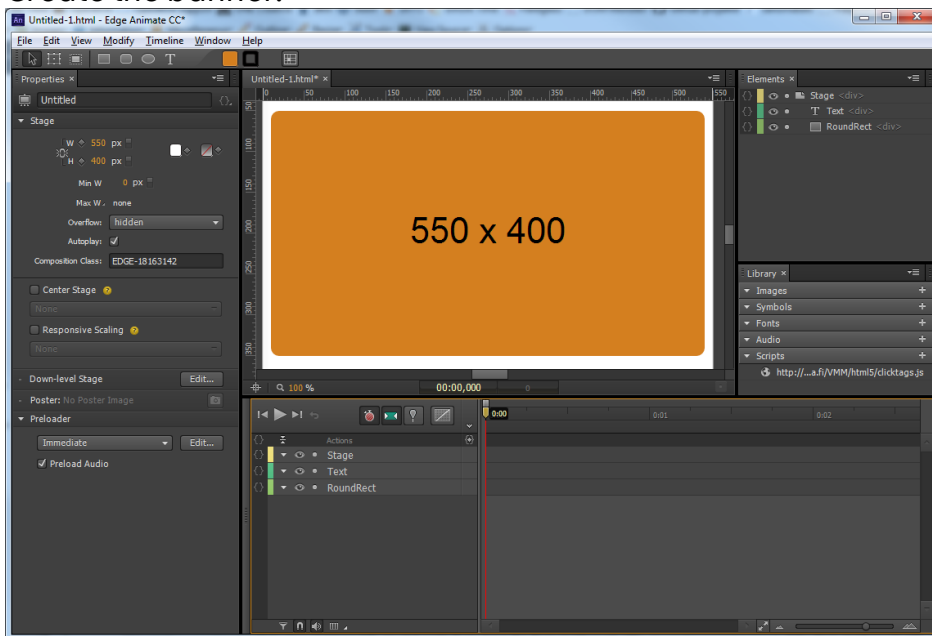

3. Copy-paste the following Javascript File URL and press “OK”:

<https://sn.sanoma.fi/js/ClicksApi.js>

**Note: The URL mentioned in the picture below might be different, always use the one that is mentioned in instructions rather than what is displayed in a picture**

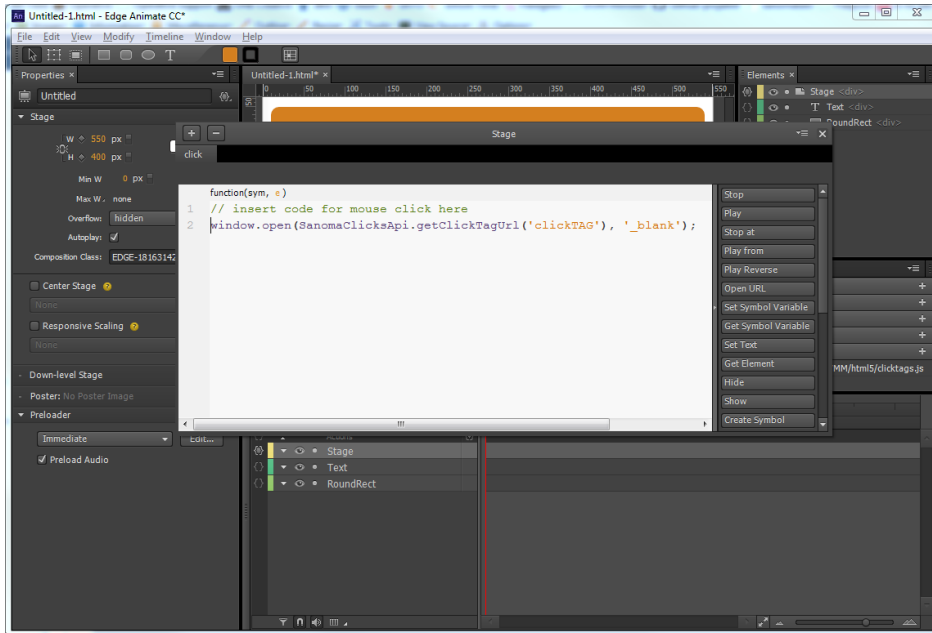

4. Create the banner.

5. Add clicktag(s) by adding one or more click events to individual elements or to the whole stage.

Use *SanomaClicksApi.openClickUrl('https://yourlinkgoeshere')*; as click code if you have the final clickthrough URL, or *SanomaClicksApi.openClickTag()* if the final clickthrough URL is decided later. Since September 2020 the argument can be omitted and ClicksApi will use clicktag defined in ad creative.

**Note: The code mentioned in the picture below might be different, always use the one that is mentioned in instructions rather than what is displayed in a picture**

6. Preview and publish your banner.
